

fn match_group_by_truncation

Michael Shoemate

September 5, 2025

This proof resides in “**contrib**” because it has not completed the vetting process.

Proves soundness of `match_group_by_truncation` in `mod.rs` at commit `f5bb719` (outdated¹).

39     return true_set, false_set

```

Postcondition

Theorem 1.1 (Postcondition). For a given query plan and user identifier expression, if the query plan bounds row contributions per-identifier via a group by, returns a triple containing the input to the truncation, the truncation itself, and the per-id bound on user contribution.

Proof. Lines 4-14 check if the query plan is a simple group-by, and exits without a match if not.

A valid group by truncation is a group by where the grouping keys contain a user identifier. So line 16 splits the group by keys into two sets, and line 18 rejects the match if the user identifier is not in the group by keys.

The remaining grouping columns are then reflected in the bound on user contributions, on line 24. \square
