

# CompositionMeasure for Approximate<ZeroConcentratedDivergence>

Michael Shoemate

This proof resides in “**contrib**” because it has not completed the vetting process.

Proves soundness of the implementation of `CompositionMeasure` for `Approximate<ZeroConcentratedDivergence>` in `mod.rs` at commit [f5bb719](#) (outdated<sup>1</sup>).

### Pseudocode

```
1 class CompositionMeasure(ApproximateZeroConcentratedDivergence):
2     def composability( # 
3         self, adaptivity: Adaptivity
4     ) -> Composability:
5         return Composability.Sequential
6
7     def compose(self, d_mids: Vec[Self_Distance]) -> Self_Distance:
8         rho_g, del_g = 0.0, 0.0
9         for rho_i, del_i in d_mids:
10             rho_g = rho_g.inf_add(rho_i)
11             del_g = del_g.inf_add(del_i)
12     return rho_g, del_g
```

### Postcondition

**Theorem 1.1.** `composability` returns `Ok(out)` if the composition of a vector of privacy parameters `d_mids` is bounded above by `self.compose(d_mids)` under `adaptivity` adaptivity and `out`-composability. Otherwise returns an error.

*Proof.* By the postcondition of `InfAdd` we have that  $\sum_i d_{mids_i} \leq \text{compose}(d_{mids})$ , where the summation is applied independently to rhos and deltas, and the comparison applies to both the global rho and global delta.

<sup>1</sup>See new changes with `git diff f5bb719..cb1a651 rust/src/combinators/sequential_composition/mod.rs`

Adaptivity	Sequential	Concurrent
Non-Adaptive	Lemma 8.2[ <a href="#">BS16</a> ]	None
Adaptive	Lemma 8.2[ <a href="#">BS16</a> ]	None
Fully-Adaptive	Theorem 1[ <a href="#">WRRW23</a> ]	None

This table is reflected in the implementation of `composability` on line 2.
