# fn match\_group\_by\_truncation

Michael Shoemate

April 22, 2025

This proof resides in "contrib" because it has not completed the vetting process.

Proves soundness of match\_group\_by\_truncation in mod.rs at commit f5bb719 (outdated1).

```

### Postcondition

**Theorem 1.1** (Postcondition). For a given query plan and user identifier expression, if the query plan bounds row contributions per-identifier via a group by, returns a triple containing the input to the truncation, the truncation itself, and the per-id bound on user contribution.

*Proof.* Lines 4-14 check if the query plan is a simple group-by, and exits without a match if not.

A valid group by truncation is a group by where the grouping keys contain a user identifier. So line 16 splits the group by keys into two sets, and line 18 rejects the match if the user identifier is not in the group by keys.

The remaining grouping columns are then reflected in the bound on user contributions, on line 24.
