fn make_privacy_filter

Michael Shoemate

This proof resides in "contrib" because it has not completed the vetting process.

Proves soundness of fn make_privacy_filter.

1 Hoare Triple

Precondition

Compiler-verified

- Argument odometer of type Odometer<DI, MI, MO, Q, A>.
- Argument d_out of type MO_Distance, the associated distance type of MO.
- Generic DI implements Domain.
- Generic MI implements Metric.
- Generic MO implements Measure.
- MI_Distance implements ProductOrd.
- MO_Distance implements ProductOrd.
- (DI, MI) implements MetricSpace.

User-verified

Pseudocode

```
def make_privacy_filter(
      odometer: Odometer[DI, MI, MO, Q, A],
      d_in: MI_Distance,
      d_out: MO_Distance,
  ) -> Measurement[DI, OdometerQueryable[MI, MO, Q, A], MI, MO]:
      odo_function = odometer.function
      def function(arg: DI_Carrier) -> OdometerQueryable[MI, MO, Q, A]:
          continuation_rule = new_continuation_rule(d_in, d_out, MI, MO)
10
11
          return wrap(continuation_rule, lambda: odo_function.eval(arg))
12
      def privacy_map(d_in_p: MI_Distance) -> MO_Distance:
13
          if d_in_p.total_gt(d_in):
14
              raise "input distance must not be greater than d_in"
```

```
return d_out

return Measurement.new(
    odometer.input_domain,
    Function.new_interactive(function),
    odometer.input_metric,
    odometer.output_measure,
    PrivacyMap.new_fallible(privacy_map),

return Measurement.new(
    odometer.input_domain,
    Function.new_interactive(function),
    odometer.output_measure,
    privacyMap.new_fallible(privacy_map),
```

Postcondition

For every setting of the input parameters (odometer, d_out, DI, MI, MO, Q, A) to make_privacy_filter such that the given preconditions hold, make_privacy_filter raises an error (at compile time or run time) or returns a valid odometer. A valid odometer has the following properties:

- 1. (Data-independent runtime errors). For every pair of members x and x' in input_domain, invoke(x) and invoke(x') either both return the same error or neither return an error.
- 2. (Valid odometer queryable). For every member x in input_domain, where function(x) does not raise an error, function(x) returns a valid odometer queryable.

Proof of data-independent errors. Function.eval on line 11 has data-independent exceptions, because the function is from odometer, which is a valid odometer. Since this is the only location where an exception can be raised, the data-independent errors property holds.

Proof of privacy guarantee. By the definition of a valid odometer queryable, the output of make_privacy_filter upholds the privacy guarantee.
