CompositionMeasure for Approximate<ZeroConcentratedDivergence>

Michael Shoemate

This proof resides in "contrib" because it has not completed the vetting process.

Proves soundness of the implementation of CompositionMeasure for Approximate<ZeroConcentratedDivergence> in mod.rs at commit f5bb719 (outdated¹).

Pseudocode

```
class CompositionMeasure(ApproximateZeroConcentratedDivergence):
    def composability( #
        self, adaptivity: Adaptivity
    ) -> Composability:
        return Composability.Sequential

def compose(self, d_mids: Vec[Self_Distance]) -> Self_Distance:
        rho_g, del_g = 0.0, 0.0

    for rho_i, del_i in d_mids:
        rho_g = rho_g.inf_add(rho_i)
        del_g = del_g.inf_add(del_i)
    return rho_g, del_g

return rho_g, del_g
```

Postcondition

Theorem 1.1. composability returns Ok(out) if the composition of a vector of privacy parameters d_mids is bounded above by self.compose(d_mids) under adaptivity adaptivity and out-composability. Otherwise returns an error.

Proof. By the postcondition of InfAdd we have that $\sum_i d_{mids_i} \leq compose(d_{mids})$, where the summation is applied independently to rhos and deltas, and the comparison applies to both the global rho and global delta.
