fn then_saturating_cast_hashmap

Michael Shoemate

This proof resides in "contrib" because it has not completed the vetting process.

Proves soundness of the implementation of then_saturating_cast_hashmap in mod.rs at commit f5bb719 (outdated¹).

1 Hoare Triple

Precondition

Compiler-Verified

- Generic TK implements trait Hashable
- Generic TV implements trait SaturatingCast<IBig>

User-Verified

None

Pseudocode

```
def then_saturating_cast_hashmap() -> Function[HashMap[TK, IBig], HashMap[TK, TV]]:
return Function.new(lambda x: {k: TV.saturating_cast(v) for k, v in x.items()})
```

Postcondition

Theorem 1.1. For every setting of the input parameters (TK, TV) to then_saturating_cast_hashmap such that the given preconditions hold, then_saturating_cast_hashmap raises an exception (at compile time or run time) or returns a valid postprocessor. A valid postprocessor has the following property:

1. (Data-independent errors). For every pair of elements x, x' in input_domain, function(x), function(x') either neither or both raise an error. If both raise an error, then they both raise the same error.

Proof. Since T.saturating_cast is infallible, the function is infallible, meaning that the function cannot raise data-dependent errors. Therefore the function is a valid postprocessor. \Box
