CompositionMeasure for MaxDivergence

Michael Shoemate

This proof resides in "contrib" because it has not completed the vetting process.

Proves soundness of the implementation of CompositionMeasure for MaxDivergence in mod.rs at commit f5bb719 (outdated1).

Pseudocode

```
class CompositionMeasure(MaxDivergence):
    def composability( #
        self, adaptivity: Adaptivity
    ) -> Composability:
        if matches(adaptivity, Adaptivity.FullyAdaptive):
            raise "fully-adaptive composition is not currently supported for max-divergence"
    return Composability.Concurrent

def compose(self, d_mids: Vec[Self_Distance]) -> Self_Distance:
        d_out = 0.0
    for d_mid in d_mids:
        d_out = d_out.inf_add(d_mid)
    return d_out
```

Postcondition

Theorem 1.1. composability returns Ok(out) if the composition of a vector of privacy parameters d_mids is bounded above by self.compose(d_mids) under adaptivity adaptivity and out-composability. Otherwise returns an error.

Proof. By the postcondition of InfAdd we have that $\sum_i d_{mids_i} \leq compose(d_{mids})$.

Adaptivity	Sequential	Concurrent
Non-Adaptive	Theorem 1[DMNS06]	Theorem 1.8[VW21]
Adaptive	Theorem 1[DMNS06]	Theorem $1.8[VW21]$
Fully-Adaptive	None	None
