CompositionMeasure for RenyiDivergence

Michael Shoemate (@Shoeboxam)

This proof resides in **"contrib"** because it has not completed the vetting process.

Proves soundness of the implementation of CompositionMeasure for RenyiDivergence in mod.rs at commit f5bb719 (outdated[1]).

Pseudocode

```
class CompositionMeasure(RenyiDivergence):
    def composability(  #
        self, adaptivity: Adaptivity
    ) -> Composability:
        return Composability.Concurrent

    def compose(self, d_mids: Vec[Self_Distance]) -> Self_Distance:
        def curve(alpha: float) -> float:  #
            epsilons = [d_mid(alpha) for d_mid in d_mids]

            d_out = 0.0
            for d_mid in epsilons:
                d_out = d_out.inf_add(d_mid)
            return d_out

        return Function.new_fallible(curve)
```

Postcondition

Theorem 1.1. `composability` returns `Ok(out)` if the composition of a vector of privacy parameters `d_mids` is bounded above by `self.compose(d_mids)` under `adaptivity` adaptivity and `out`-composability. Otherwise returns an error.

Proof. The new curve constructed on line 8 composes all epsilon parameters at a given fixed `alpha`. By the postcondition of InfAdd we have that for any choice of `alpha`, $\sum_i \texttt{d_mid}_i(\texttt{alpha}) \leq \texttt{compose(d_mids)}(\alpha)$.

[1] See new changes with `git diff f5bb719..5c6c303 rust/src/combinators/sequential_composition/mod.rs`

Adaptivity	Sequential	Concurrent
Non-Adaptive	Proposition 1[Mir17]	Theorem 2[Lyu22]
Adaptive	-	-
Fully-Adaptive	Theorem 4.3[FZ22]	Theorem 1.22[VW21]

This table is reflected in the implementation of `composability` on line 2.
